## 1 SUMMARY

Smartgen SGQ Automatic Transfer Switch (ATS) is used in conditions from AC660V 50/60HZ to DC250V which under structure of electromagnetism driving. SGQ ATS can make fast loading transfer (transfer time $\leq 80 \mathrm{~ms}$ ) under two ways power supply. Also ATS can be widely used in Hi-buildings, post, telecommunications, mines, ships, medical, public health, military installations, and so on. Two ways power can be mains, gens and storage battery.

## 2 OPERATING CONDITIONS

| Items | Specifications |
| :--- | :--- |
| Operating voltage | AC220V $(176 \sim 265) \mathrm{V}$ |
| Ambient air temperature | $(-40 \sim+70)^{\circ} \mathrm{C}$ |
| Air Humidity | $(20 \sim 90 \%$ |
| Elevation | $\leq 5000 \mathrm{~m}$ |
| Pollution Class | 3 |
| Installation gradient | $\leq 22.5^{\circ}$ |

## 3 SPECIFICATION

| Type | Volume | Specification |
| :---: | :--- | :--- |
| $N$ | $\leq 125 A$ | $63 A, 125 A$ |
| $T$ | $160 A \sim 630 A$ | $160 A, 200 A, 250 A, 400 A, 630 A$ |
| $M$ | $630 A \sim 1250 A$ | $630 A, 800 A, 1000 A, 1250 A$ | | Note: All types of Smartgen ATS series have 3 poles and 4 poles (only 63A |
| :--- |
| and 125A have 2 poles). |

## 4 TYPE INSTRUCTION

## 5 STRUCTURE

Smartgen SGQ Automatic Transfer Switch (ATS) apply for structure of magnet coil driving and two ways interlocking of electric and mechanical. And ATS's major contact structure is two-stable and one-moving, and the moving contact is " V " type design, in order to ensure there is no short circuit of the two-ways power supply. " N " and " T " apply for structure of single coils operation and the coil only have current while it is transferred, and this can extremely extend the using life of switch. The control power of coil is supplied from mains and backup, and no use to add up other control power. The switch has close indication of electric and mechanical by itself and also offers 2 ways NO/NC voltage free auxiliary contacts at the same time.

## 8 INSTALLATION AND TESTING

The installation and testing of ATS must be operated by experts and people who much learn about switch equipments. Protection and preventive measures must be considered during the operation. The wires connection of switch major loop must make its down lead prohibit from any pressure and strong force. Should inspect if have any damage to switch or any harmful environment before installation or debugging. Meanwhile, should check the wires connection if loose during transportation. Also should make the switch is clean and clean way smudge, special prohibit any smudges on the surface of
insulation parts. The smudges could be caused from the packing materials during transportation or in storage. When connect main loop, should make the two-ways power phase sequence as same. Also should strictly follow to wires diagram in manual when connect to second loop and pay attention to control the voltage grade of power. There must be have excellent ground-connection when installation. Considering the personal safety and quickness of switch transfer, the debugging handle for testing only and users never operate it with load. Should use handle to operate the switch first when debugging. If everything goes well, using manual button to power-driven operation. And ATS is normal running after there is no error.
